Municipalities in Sweden redeploy SeaGuards to understand ecosystem changes in the Oeresund area.

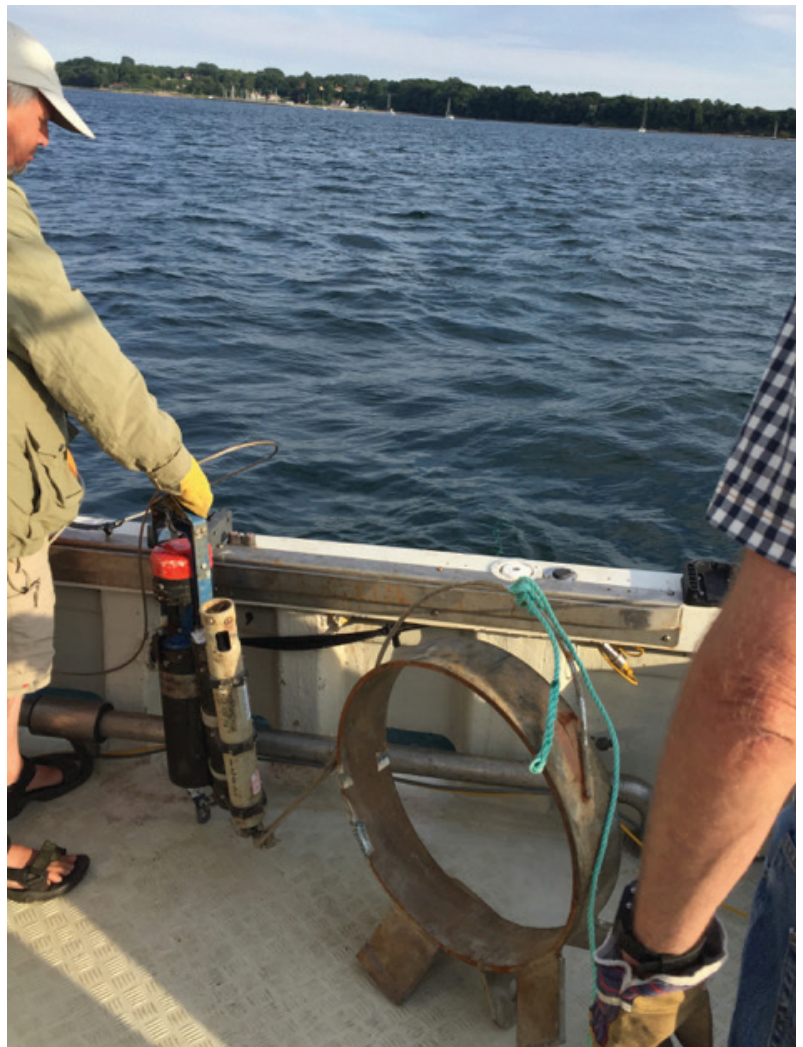

## Understand the dynamics of the ecosystem

In the Oeresund strait between Denmark and Sweden the marine environment has improved over the past 30 years. It has been noted however that despite the amelioration bottom living key species have disappeared.

The Swedish municipalities of Helsingborg and Landskrona requested the redeployment of SeaGuard instruments at two locations in order to follow trends and better understand the dynamics of the ecosystem.

Oxygen, Temperature, Salinity, Currents and Water Level are measured with the instruments that were redeployed last week (July 23rd, 2016). The previous deployment produced more than 10-year long continuous hourly data.
